Step 1: Define Your Target User & Problem

Target Audience

Primary users are **urban working professionals and college students (ages 18–35)** who want to eat healthier but struggle to plan meals consistently. They are busy, rely on food delivery frequently, and lack clarity on what to eat daily based on their health goals, preferences, and constraints (budget, time, diet type).

Target User (User Segmentation Framework)

Primary Segment (Beachhead Users)

- **Who:** Urban working professionals & college students
- **Age:** 18–35
- **Behavior:** Busy schedules, frequent food ordering, irregular meal habits
- **Mindset:** Health-aware but inconsistent
- **Constraints:** Time, mental effort, budget, limited nutrition knowledge

Secondary Segment

- Fitness-conscious users tracking calories/macros
- Users with dietary preferences (vegetarian, vegan, diabetic-friendly, etc.)

Problem Statement

Busy individuals want to eat healthy and meet fitness or wellness goals, but **lack time, knowledge, and consistency** to plan balanced meals. Existing solutions are either too generic, time-consuming, or fail to adapt to personal preferences and daily routines.

• User persona

Name: Aarav

Age: 26

Occupation: Software Engineer

Location: Tier-1 city

Goals:

- Eat healthier without spending extra time
- Maintain energy throughout the workday
- Avoid impulsive junk food orders

Key Problems to Solve (Pain Point Prioritization)

1. Decision Fatigue

Users spend mental energy deciding meals every day, leading to poor choices.

2. Low Personalization

One-size-fits-all meal plans don't align with individual preferences or constraints.

3. Low Adherence

Users abandon meal plans because they are hard to follow or too rigid.

Step 2: Map Key User Flows

User Journey 1 — Create Weekly Meal Plan (Core Flow)

Goal:

Help users plan their entire week quickly.

1. User opens the meal planning app
2. Clicks "Start Planning"
3. Selects dietary preference (Veg / Vegan / Keto etc.)
4. Selects cooking time availability (15 / 30 / 45 mins)
5. Adds pantry ingredients (rice, eggs, onion etc.)

- 6.App recommends weekly meal plan
- 7.User reviews suggested meals
- 8.User edits or customizes meals if needed
- 9.User saves the weekly plan

User journey 2

Alternate Journey: “I Don’t Know What I Want” (Low-Intent Users)

User Goal: “Just tell me what to eat today.”

Step-by-Step Flow

1. User opens the app feeling indecisive
2. Taps **“Suggest today’s meals”**
3. App uses:
 - Past behavior
 - Time of day
 - Dietary preferences
4. Shows a **simple daily meal suggestion**
5. User accepts suggestion
6. App nudges: **“Want this for the whole week?”**
7. User converts to a weekly plan

User journey-3

Customization Journey: Modify an Existing Plan (Power Users)

User Goal: “I like the plan, but I want control.”

Step-by-Step Flow

1. User opens saved weekly plan
2. Selects a specific day or meal

3. Taps “**Replace meal**”
4. App suggests alternatives (same calories / same prep time)
5. User selects replacement
6. Plan updates instantly

User journey 4

Recovery Journey: User Skips or Breaks the Plan

User Goal: “I messed up today — help me recover.”

Step-by-Step Flow

1. User skips a planned meal or orders outside food
2. App detects inactivity or deviation
3. Sends a supportive nudge (not guilt-driven)
4. Offers:
 - Adjusted meals for the rest of the day/week
5. User re-engages without restarting everything

User journey 5

Onboarding-to-First-Value Flow (Critical for Retention)

User Goal: “Is this app useful for me?”

Step-by-Step Flow

1. App install & sign-up
2. 3–4 quick preference questions (under 60 seconds)
3. Immediate generation of a **sample weekly meal plan**
4. User sees value *before* deep setup
5. Optional deeper personalization later

Flow Summary

Flow Type	User Intent	PM Focus
Core Weekly Plan	High intent	Speed & clarity
Daily Suggestion	Low intent	Conversion
Customization	Power users	Flexibility
Recovery	Drop-off risk	Retention
Onboarding	New users	Activation

Step 3

Build Your Prototype (in Lovable)

Objective:

Design a simple, functional solution that addresses the problem.

I built a clickable prototype in Lovable that allows users to quickly create a personalized weekly meal plan by selecting their dietary preferences and health goals. The flow is simple and mirrors real-life routines, ensuring ease of use and fast value delivery

Part 4 Test and Refine

user Feedback & Iteration

After sharing the initial prototype with a working professional, I received feedback that while the concept was strong, the experience could feel more grounded in real-life daily routines.

Based on this feedback, I iterated on the design to better support practical, everyday usage. The updated prototype focuses on:

- More realistic and simple meal options
- Clear weekly structure with easy day navigation
- Visible indicators for quick preparation and dietary preferences
- Improved flexibility through easy meal swapping

These changes helped make the experience feel more personalized, approachable, and suitable for busy users, while keeping the interface simple and easy to use.

Feedback source: Working professional (early user review)

Based on early user feedback, I made several improvements to the app to enhance usability and engagement. Images were added to each dish to make meal selection more intuitive and visually appealing. A shop icon was introduced for quicker access to groceries, along with dedicated sections for Pantry, Saved Meals, and User Profile to improve navigation and organization.

These screens showcase recent enhancements including dish images, a shop icon, and organized sections for Pantry, Saved Meals, and Profile—making the app more intuitive and user-friendly.

Overall Advantage: These updates improve user engagement and reduce the effort required to plan, save, and manage meals efficiently.
