

Meesho enables millions of Indians—especially users from **Tier-2, Tier-3 cities and small towns**—to buy affordable products online. While the platform has achieved massive scale, internal data and feedback suggest that a **large portion of users become inactive after a few transactions**.

As a **Product Manager team**, your goal is to **increase transactions per user (ARPU)** by understanding user behavior, identifying blockers to higher basket sizes and repeat usage, and proposing research-backed product solutions.

You will complete this assignment **as a group of 3**, dividing responsibilities across research, synthesis, ideation, and prioritization.

Your assignment is divided into two parts:

Part 1: User Research & Questionnaire (Group Activity)

Part 2: Persona Creation & Problem Definition (Group Synthesis)

Part 3: Group Ideation – Top 6 Solutions

Part 4: Prioritization Using RICE Framework (Group Decision)

User Segment

User Segment	Pain Points	Opportunities
First-time buyers, low trust, price-sensitive	Fear of poor quality, hesitant to repeat	Build trust via reviews, easy returns, first-purchase guarantees
Budget Families Household buyers, basket size small but frequent needs	Limited disposable income, shipping costs	Bundle essentials, subscription packs, family discounts
Aspiring Trendsetters Young Tier-2/3 users, fashion-conscious	Quality inconsistency, lack of personalization	Curated collections, influencer-led campaigns, style guarantees
Social Influenced Shoppers Rely on WhatsApp/Facebook groups, peer-driven	Lack of community features on Meesho	Enable group-buying, referral rewards, social shopping features
Loyal Value Seekers Repeat buyers, focus on affordability	No loyalty program, limited incentives	Cashback, tiered loyalty rewards, gamified shopping

Problem Framing-5 Why's

5 Why's	Pain Points
Who:	Primary users: Tier-2 and Tier-3 city residents, small-town buyers, budget-conscious families, and young aspirational shoppers. Secondary stakeholders: Meesho sellers (whose growth depends on repeat buyers), and the product team (focused on ARPU growth).
What:	Users become inactive after 2–3 transactions , leading to low repeat usage and smaller basket sizes . This directly impacts Average Revenue Per User (ARPU) , which is critical for Meesho's long-term profitability and retention
Where	Digital context: Meesho's mobile app and social commerce channels (WhatsApp, Facebook groups). Geographic context: Predominantly Tier-2, Tier-3 cities and small towns in India, where trust in online shopping is still developing and offline markets remain strong competitors.
When	Critical drop-off point: After initial adoption (first 1–3 purchases). Timing sensitivity: Early churn happens within the first month of joining, before loyalty or habit formation.
Why	Trust gap: Concerns about product quality, delivery reliability, packaging issues broken item delivery and refunds Limited incentives: Discounts are one-time, loyalty programs are weak, and personalization is minimal. Late delivery: Logistic issue, Basket friction: Users hesitate to add more items due to cost, shipping fees, or lack of bundled offers. Behavioral fallback: Users revert to offline shopping where trust and familiarity are higher.

Problem Statement

Meesho's Tier-2/3 users, who initially adopt the app for affordability, often become inactive after 2–3 purchases on the mobile platform, especially within their first month, due to low trust in product quality, delay in delivery, due to cost of product and shipping, limited incentives for repeat purchase, and basket-size friction — resulting in stagnant ARPU growth.

6 solutions directly tackle the ARPU + inactivity problem by addressing trust, incentives, personalization, social influence, and transaction ease

Solution	When Situation Comes	I want to - Motivate	So I Can Expected Outcome
Trust-First Guarantee Program	A new user hesitates after their first purchase, worried about product quality.	Reassure them with visible “Trust Guarantee” badges, easy returns, and verified sellers	Build confidence, reduce churn, and encourage repeat transactions.
Family Essentials Bundles	A budget-conscious family is adding only 1–2 items due to shipping costs.	Offer bundled packs (groceries, household essentials) with free shipping or subscription discounts	Increase basket size and drive regular, repeat purchases.
Curated Fashion Collections	A young shopper browses but feels overwhelmed or unimpressed by generic listings.	Showcase curated, influencer-led collections tailored to their style preferences.	Improve product discovery, boost engagement, and grow ARPU through higher-value baskets.

6 solutions directly tackle the ARPU + inactivity problem by addressing trust, incentives, personalization, social influence, and transaction ease

Solution	When Situation Comes	I want to - Motivate	So I Can Expected Outcome
Social Group-Buying Feature	A user sees a product but waits for peer validation before buying.	Enable group-buy discounts when friends or community members purchase together.	Leverage social influence, increase transaction frequency, and build habit loops.
Tiered Loyalty & Cashback Program	<i>Loyal Value Seekers (repeat buyers, affordability-focused)</i>	Weak loyalty incentives, no sustained rewards.	Repeat buyers need ongoing motivation. A tiered loyalty program (bronze/silver/gold levels with cashback, free shipping, exclusive deals) sustains engagement and increases ARPU over time
Seamless Payments & COD Rewards	Cross-segment (all personas, esp. Budget Families & New Explorers)	Payment friction (failed UPI, COD reliance).	Simplify UPI flows with “one-tap retry”. Reward COD users who shift to digital (cashback/discount). This reduces friction, builds trust, and increases transaction completion rates

Prioritization Using RICE Framework (Group Decision)

	Reach Active User 10%-20%-Low 30%-50 % Medium 60% + High	Impact Effect ARUP Low Marginal Medium: Noticeable High - Transformative	Confidence : Based On Research Low<50% Medium 70% High 85%	Effort Relative Complexity 0-low 5-High	RICE Score: (Reach x Impact x Confidence) / Efforts
Trust First Guarantee Program	High New users + Old users out of 100% we can say 95% users need trust	High long term	High Most of users demand Quality product and fast delivery. Easy Return policy	High requires seller verification, return policy upgrades, logistics	$(9 \times 9 \times 9) \div 3 \approx$ $243 \div 3 = 81$
Family Essentials Bundles	Medium 30-40 House holds	Medium basket size growth	Medium (Dependency on bundle adoption)	Medium. Application change and Logistic bundling	$(6 \times 6 \times 7) \div 3 \approx$ $252 \div 3 = 84$
Curated Fashion Collections	Medium 25-35% Young aspirational shoppers	High value basket	Medium	High Personalize engins and influencer partnership	$(5 \times 9 \times 6) \div 4 \approx$ $210 \div 4 = 52.5$

Prioritization Using RICE Framework (Group Decision)

	Reach Active User 10%-20%-Low 30%-50 % Medium 60% + High	Impact Effect ARUP Low Marginal Medium: Noticeable High - Transformative	Confidence : Based On Research Low<50% Medium 70% High 85%	Effort Relative Complexity 0-low 5-High	RICE Score: (Reach x Impact x Confidence) / Efforts
Social Group-Buying Feature	50% Social influencer shopper	High Long term	Medium	High New feature build, back-up discount logic	$(7 \times 8 \times 6) \div 4 \approx 336$ $\div 4 = 84$
Tiered Loyalty & Cashback Program	Medium (25–35% repeat buyers)	High Long term growth	High	Medium program design, tracking, reward system	$(6 \times 8 \times 8) \div 3 \approx 384$ $\div 3 = 128$
Seamless Payments & COD Rewards	High (60%+ users rely on COD or face UPI friction)	Medium-High (reduces drop-offs, increases completed transactions)	High (payment friction repeatedly cited in research)	Medium(payment gateway optimization, reward integration)	$(9 \times 7 \times 8) \div 3 \approx 504$ $\div 3 = 168$
